
Combination of parts
the whole is a function of its parts
Chunking
orthogonal: stores a composite as a unit
Blending
parts not recoverable, even from a vocabulary, or roles collide
Fixed-width superposition
role-distinct; recoverable only by clean-up over a known vocabulary
Role–filler composition
parts recoverable, including parts never seen before
symmetric: $x + y$, $x \odot y$; head–modifier, prototypes; conceptual blending
HRR, MAP, $x + 0.5y$, projections with $m < kd$ (fresh-part ceiling rank/kd)
tensor products, concatenation, superposition in disjoint regions, slots and templates
Familiar parts: decodable whenever the relation is injective on the vocabulary
Systematicity and productivity are contingent on the data
Fresh parts: recoverable
Systematicity is necessary
